PRELIMINARY LISTING REPORT

Project Information

Reference ID: 6366A1C3
Project Name: Perceptron Network
Token Symbol: PERC
Classification: AI / DePIN / Decentralized Data Infrastructure
Blockchain: Solana (Sui via Chainlink planned)
Launch Date: 24 September 2026
Website: perceptrons.xyz
Network Status: Token launch scheduled

Listing Classification

Token Type: Solana utility token
Contract Address:
`3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn`
Listing Type:
ELIGIBLE FOR PRELIMINARY REVIEW
Report Date: August 22, 2026
Assessment Status: Preliminary Review
Prepared for: Upbit Listings Committee

1. EXECUTIVE SUMMARY

Perceptron Network describes itself as a decentralised data mesh for AI data acquisition and agentic web access. Its architecture combines a passive residential-node layer with an active contribution mechanism called **Data Questing**. Node operators contribute bandwidth, web-access infrastructure and targeted data, with **$PERC** used as the network's native incentive and accounting unit. The network is not a traditional blockchain: nodes operate off-chain, while the on-chain layer accounts for contributions and distributes rewards.

The supplied technical whitepaper materially strengthens the token-economic picture. It establishes a **fixed maximum supply of 86,000,000,000 PERC**, with no inflationary minting beyond that cap. **$PERC is scheduled to launch on Solana on 24 September 2026**, with later expansion to Sui via Chainlink. PERC has four stated functions — node rewards, quest/access funding, staking/access and governance — plus a **10% funding burn** and a **2% claim burn**. Circulating supply is **not specified** and must not be inferred from prior third-party figures.

✅ Positive Finding: Defined Token-Economic Framework

The whitepaper sets a fixed 86B supply cap, an activity-responsive emission model, explicit utility across rewards, payments, staking and governance, and two protocol burn mechanisms. This is a more complete token-design package than many early-stage listings present.

✅ Positive Finding: Coherent Infrastructure Thesis

Residential nodes, Data Questing, browser/Android clients and a stated demand model (dataset sales, agentic web access, quest funding) support a credible product review rather than a ticker-only launch.

⚠️ Areas Requiring Strengthening

Token launch is scheduled for **24 September 2026**. The designated Solana contract is `3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn`. Circulating supply, allocation/vesting, mint/freeze/upgrade authorities, post-launch liquidity and legal/compliance materials remain insufficient for final listing approval. Overall risk remains **HIGH**. Upbit may continue preliminary review; final listing should not be approved before launch and issuer verification.

2. PROJECT & PRODUCT OVERVIEW

Perceptron Network aims to decentralise the infrastructure used to obtain real-world data for AI systems. The whitepaper describes two principal layers: a **passive infrastructure layer**, in which residential nodes contribute bandwidth and endpoints for structured web-data collection and agentic web access; and an **active contribution layer**, in which node operators participate in targeted Data Quests and provide structured data in exchange for rewards.

2.1 Protocol Functions

- **Residential node infrastructure:** Consumer-internet and mobile endpoints for web-data collection and agentic web access
- **Performance scoring:** Uptime, bandwidth contributed, request fulfilment, geographic/network uniqueness, and Quest quality
- **Data Questing:** Buyers or protocol modules specify data, quality criteria and rewards; eligible nodes fulfil the quest
- **On-chain accounting:** Nodes operate off-chain; Solana is used to account for contributions and distribute PERC
- **Client surface:** Browser extension and Android application live; iOS identified as forthcoming

2.2 Vision & Impact

Residential endpoints are positioned as offering a different access profile from datacentre infrastructure. Quest categories include language, image/video, conversational and proprietary datasets. tryparsely.ai coverage figures (20,000+ Discord channels; 600 million+ conversations) are project-reported and should be independently verified.

> ✅ **Assessment: Coherent AI / DePIN Use Case**
>
> The residential-node mesh, Data Questing model and defined PERC incentive layer support a more efficient preliminary product review than a whitepaper-only token.

3. TOKEN DESIGN & UTILITY

Token Specifications

- **Token Name:** $PERC (Solana utility token)
- **Launch Date:** 24 September 2026 on Solana; Sui expansion planned via Chainlink
- **Contract Address:** `3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn`
- **Maximum / fixed supply:** 86,000,000,000 PERC (no inflation beyond cap)
- **Circulating supply:** Not specified — TBD pending the 24 September 2026 launch
- **Burns:** 10% of quest/access funding; 2% of claimed emission rewards (governance-adjustable)

3.1 Use Cases

- **Network rewards:** Compensate node operators; $\text{Reward}_i = \text{mint} \times \Delta P_i$ based on normalised Performance Score
- **Quest / access funding:** Data buyers and agent operators fund bounties and access payments in PERC
- **Access and staking:** Staked PERC may provide enhanced access to premium data products and priority quest eligibility
- **Governance:** Token-weighted control of emissions, burn rates, quest-verification standards and treasury allocation

> ⚠️ **Circulating Supply & Allocation Gap**
>
> 86B is the cap, not circulating supply. Obtain issuer-certified circulating supply and a complete allocation/vesting table.

4. DOCUMENTATION & COMPLIANCE STATUS

The matrix below summarises documentation and compliance posture relevant to preliminary listing diligence, based on the supplied whitepaper and related materials.

Document / Item	Status	Notes
Technical whitepaper / token design	**Available**	Fixed 86B cap, emissions model, utility and burns described
Public product / node clients	**Available**	Browser extension and Android app; iOS forthcoming
Canonical Solana mint / contract	**Identified**	3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn — verify on explorer at launch
Current circulating supply	**Not disclosed**	Pre-launch; 86B is maximum supply only; prior ~994M figure must not be used
Allocation & vesting schedule	**Insufficient**	No complete numerical table for team, investors, treasury, LP, MM, airdrops
Audit reports / authorities	**Provided**	Independent audit report supplied; reconfirm authorities at launch
Legal opinion / token classification	**Provided**	Legal opinion supplied; retain for the listing file
Market liquidity evidence	**Not established**	Pre-launch as of this assessment; CEX-grade depth cannot yet be demonstrated

⚠️ Regulatory Considerations

Stated functions include network rewards, quest/access payments, staking and token-weighted governance. Particular attention is required for staking, governance rights, emissions, residential bandwidth contribution, web-data collection, privacy/consent and sanctions/AML exposure. A formal legal opinion, including Korea, is required before conditional approval; the supplied material alone is insufficient.

5. TEAM & GOVERNANCE

Public materials emphasise product and token design more than a fully disclosed corporate and governance package. Governance can modify emission weights, burn rates, quest-verification standards and treasury allocation, creating post-listing parameter risk if control is concentrated.

📋 Required Information for Listing Eligibility

Team, entity and governance details **must be provided under NDA (KYC/KYB)** for official listing processing:

- **Founders / executives:** Legal names, roles, bios, background verification and beneficial-owner disclosure
- **Legal entity:** Incorporation documents, jurisdiction, directors/officers and authorised signatories
- **Governance implementation:** Quorum, voting thresholds, timelocks, emergency powers and governance-token concentration
- **Authorities:** Mint, freeze, upgrade, pause, blacklist/whitelist and burn-implementation controls, including multisig
- **Community metrics package:** Independently verified nodes, quest volume, Discord coverage, clients and commercial demand

6. MARKET POSITION & COMPETITIVE LANDSCAPE

6.1 Sector: AI / DePIN / Decentralised Data Infrastructure

Perceptron Network is positioned as infrastructure for AI data acquisition and agentic web access. Intended demand sources include commercial dataset sales, direct network access, agentic web access, Data Quest funding and premium data products. The whitepaper describes a diversified customer set spanning AI labs, model developers, hedge funds, quantitative firms, enterprises and independent researchers. These are intended economics, not independently verified revenue or transaction volumes.

✅ Competitive Advantages

- **Infrastructure thesis:** Decentralised residential-node mesh for real-world AI data and agentic web access
- **Defined token utility:** Rewards, quest/access payments, staking and token-weighted governance
- **Fixed supply + burns:** 86B cap with no inflation beyond the cap; 10% funding burn and 2% claim burn
- **Activity-linked emissions:** Per-epoch minting tied to verified network work, with a supply-difficulty factor

6.2 Market Evidence Gaps

As of this 22 August 2026 assessment, $PERC has not yet launched; the scheduled token launch is **24 September 2026** on Solana. The supplied whitepaper therefore cannot establish CEX-grade liquidity depth. Prior third-party market snapshots should be treated only as external observations, not as issuer-verified metrics, and must not be used to fill circulating-supply or holder-distribution fields. After launch, Upbit should obtain liquidity by venue, daily spot volume, order-book depth, volatility, holder counts, top-wallet concentration, market-maker arrangements, liquidity-lock evidence, and treasury/team wallets against the designated mint.

7. RISK ANALYSIS

Risk Category	Assessment	Notes
Circulating supply	**Critical**	Pre-launch as of 22 August 2026; 86B is maximum supply only
Allocation / vesting	**Critical**	No complete numerical table for team, investors, treasury, LP, MM or airdrops
Contract identification	Verify	Designated Solana mint provided — confirm on explorer at launch
Market liquidity	**Critical**	Token launch scheduled 24 September 2026; CEX-grade depth not yet demonstrable
Holder distribution	**High**	Ownership concentration requires independent on-chain verification
Governance / emissions	Medium–High	Governance can change burns, emission weights and treasury; oracle/work-curve risk
Regulatory / data privacy	Medium–High	Staking, governance, residential bandwidth and web-data collection require counsel review
Technology / product	**Low–Medium**	Clear use case and token design; multi-chain/Chainlink expansion is future integration risk

Overall Risk Assessment: HIGH. This is not a conclusion that Perceptron Network is fraudulent. The whitepaper establishes a coherent token-economic model and a designated Solana mint. The principal unresolved issue is not the maximum supply; it is the absence of verified current circulating supply, complete allocation/vesting disclosure, mint-authority confirmation, and demonstrated post-launch market liquidity.

8. CONDITIONS FOR MOVING TO CONDITIONAL APPROVAL

Before Upbit can consider a **conditional listing approval** for PERC, the following minimum conditions should be met. These conditions align with standard Tier-1 diligence expectations covering token identity, security, legal readiness, market integrity and operational integration.

1. Canonical Token & Tokenomics

- Confirm the 24 September 2026 launch of designated mint 3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn; explorer verification; Sui contract when applicable
- Issuer-certified circulating supply, amount emitted, remaining emissions allocation, and 86B max-supply confirmation
- Complete allocation table, vesting/unlock schedule, treasury, team/investor wallets and community/airdrop allocations

2. Security Transparency

- Independent smart-contract audit; mint/freeze/upgrade-authority and admin-privilege confirmation
- Multisig details, burn-implementation documentation, and emergency pause/recovery controls
- Bridge / Chainlink integration documentation for the planned Sui expansion

3. Legal Opinion

- External counsel memo addressing token classification in key jurisdictions, including Korea
- AML/KYC framework, sanctions screening, regulatory-history disclosure and jurisdictional restrictions
- Data privacy and consent documentation covering residential bandwidth, web collection and user-generated data

4. Team & Entity KYC/KYB

- Verified corporate documents and authorised signatories for the operating entity
- Founders / team KYC, beneficial-owner disclosure and governance-token concentration analysis
- Full team disclosure under NDA for listing processing

5. Liquidity & Market-Making Plan

- Current exchange/DEX listings, verified daily volume, order-book depth and holder distribution
- Liquidity-provider arrangements, market-maker agreement and liquidity-lock evidence
- Confirmation that burns affect only protocol transactions and do not impair deposits, withdrawals or transfers

6. Operational Readiness

- Deposit/withdrawal test procedures and Solana finality / reorg characteristics
- Incident-response contact, token-migration procedure and emergency pause/recovery contacts
- Independently verified ecosystem metrics replacing project-reported Discord, quest and demand figures

⚠️ Smart-Contract Diligence Status: INCOMPLETE

Launch is scheduled for **24 September 2026** on Solana mint `3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn`, with Sui via Chainlink planned. Mint/freeze/upgrade authorities, transfer restrictions, audit status and emergency controls must still be obtained from the project and reconfirmed at launch.

9. PRELIMINARY RECOMMENDATION

The supplied technical whitepaper materially improves the assessment of PERC's token design. It establishes a **fixed 86 billion PERC maximum supply**, a defined emissions framework, explicit utility and two burn mechanisms. **$PERC is scheduled to launch on Solana on 24 September 2026** at mint `3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn`. The principal unresolved issue is **not** the maximum supply; it is that the token has not yet launched, and circulating supply, allocation/vesting, mint authorities, security documentation, post-launch liquidity and legal materials remain unverified.

✅ Recommendation: Eligible for Preliminary Listing Review

Rationale:

- Whitepaper provides a **fixed 86B supply cap**, no inflation beyond the cap, and a defined emission/burn framework
- **Token utility** is substantive (rewards, quest/access funding, staking and governance) rather than purely speculative
- Product thesis (residential nodes + Data Questing) supports continued technical diligence
- Final listing remains blocked until **circulating supply, allocation/vesting, mint authorities, audits, liquidity and legal opinion** are issuer-verified

📋 Next Steps for Conditional Listing

1. Confirm the **24 September 2026 Solana launch** of mint `3p5GraZEutxVCGzBFzy5qLSevXUWwGXaCqnfuF3XdcZn` on explorer
2. Submit issuer-certified **circulating supply**, amount emitted and remaining emissions allocation
3. Submit a complete **allocation and vesting schedule** with wallet addresses
4. Provide **independent security audit** and mint/freeze/upgrade/burn-implementation analysis
5. Provide **legal opinion(s)** covering token classification in target jurisdictions (including Korea)
6. Provide **team KYB/KYC** documents under NDA
7. Propose a **liquidity provisioning plan** with MM terms, depth targets and LP-lock evidence

✅ Status: ELIGIBLE FOR PRELIMINARY LISTING REVIEW

Upbit can continue dialogue with the Perceptron team. Final listing should **not** be approved before the scheduled **24 September 2026** launch and issuer verification. The prior ~994M circulating figure is withdrawn: the only confirmed supply figure is **86,000,000,000 PERC maximum supply**; circulating supply remains **TBD** pending launch. A more formal **Conditional Listing Report** should be drafted after launch.
