

PRELIMINARY LISTING REPORT

Project Information

Reference ID: C2363EEF
Project Name: Animica
Token Symbol: ANM
Classification: Layer-1 / Post-Quantum Utility
Blockchain – Verifiable Compute
Blockchain: Animica (Native L1)
Website: animica.org
Network Status: Live Mainnet

Listing Classification

Token Type: Native L1 Utility Coin
Listing Type:
ELIGIBLE FOR PRELIMINARY REVIEW
Report Date: August 7, 2026
Assessment Status: Preliminary Review
Prepared for: Upbit Listings Committee
Document ID: UPB-C2363EEF

1. EXECUTIVE SUMMARY

Animica is a live post-quantum Layer-1 blockchain focused on verifiable compute. Based on publicly available information, Animica demonstrates an active blockchain ecosystem with a wallet, CLI, tutorials, explorer, and exchange interface. Public documentation covers wallet creation, node operation, mining, smart contracts, and tutorials — indicating more than a simple token launch.

This exceeds what many early-stage projects provide and reduces operational risk during exchange integration. However, several areas would likely require significant strengthening before meeting Tier-1 centralized exchange listing standards, particularly market liquidity evidence, security transparency, regulatory readiness, and comprehensive tokenomics disclosure.

✓ Positive Finding: Functional Ecosystem

Animica appears to provide a native blockchain, wallet CLI, explorer, smart contract support, mining, tutorials, developer tooling, and a trading interface. This public product surface is broader than many early-stage crypto projects and supports a more credible preliminary technical review.

✓ Positive Finding: Developer Experience

Visible tooling includes command-line utilities, wallet management, node deployment, contract deployment, and mining commands. Tier-1 exchanges generally favor projects with mature developer ecosystems and operational documentation.

⚠ Areas Requiring Strengthening

Public evidence of organic trading volume, independent audits, legal opinions, KYC/AML posture, and comprehensive tokenomics disclosures remains insufficient for Tier-1 listing standards based on reviewed sources. These items should be addressed before conditional approval review.

2. PROJECT & PRODUCT OVERVIEW

Animica aims to operate a post-quantum L1 with useful-work consensus, deterministic smart contracts, and an operational product stack spanning wallets, explorer, mining, developer tooling, and a trading interface. The project's public posture emphasizes a functioning blockchain ecosystem rather than a whitepaper-only launch.

2.1 Protocol Functions

- **Native L1 operations:** Live mainnet with public RPC, explorer, and chain-verifiable state
- **Wallet & CLI tooling:** Wallet creation, key management, transfers, and command-line operations
- **Smart contracts:** Contract support with documented deployment tooling
- **Mining & useful work:** Mining infrastructure and related operational commands
- **Developer experience:** Node deployment, tutorials, and tooling beyond a minimal token launch
- **Trading interface:** Public exchange portal for ANM market access (market metrics incomplete)

2.2 Vision & Impact

Visible infrastructure — trading portal, wallet support, blockchain explorer, academy/tutorials, and node software — reduces operational risk during exchange integration. These components indicate that Animica has progressed into a functioning public product stack. Tier-1 exchanges generally favor projects with mature developer ecosystems and demonstrable infrastructure readiness.

✓ Assessment: Strong Developer Experience

Command-line tools, wallet management, node deployment, contract deployment, and mining commands indicate a comparatively mature public developer surface and support a more efficient technical diligence process.

3. TOKEN DESIGN & UTILITY

Token Specifications

- **Token Name:** ANM (native utility coin)
- **Blockchain:** Animica (Native L1)
- **Network Status:** Live mainnet
- **Total Supply:** To be disclosed comprehensively
- **Circulating Supply:** To be disclosed comprehensively
- **Website:** animica.org

3.1 Use Cases

- **Network utility:** Native coin for transactions and chain operations
- **Mining rewards:** Incentives for mining / useful-work participation
- **Developer & ecosystem payments:** Settlement within Animica tooling and services
- **Trading:** Available via public trading interface; organic volume evidence remains limited

⚠ Token Metrics Disclosure Gap

Top exchanges typically examine circulating supply, emissions schedule, treasury holdings, vesting, unlock schedules, concentration risk, and token distribution. These details were not readily apparent from the reviewed public information and should be packaged into a canonical disclosure before conditional approval.

4. DOCUMENTATION & COMPLIANCE STATUS

The matrix below summarizes publicly reviewed documentation and compliance posture relevant to preliminary listing diligence.

Document / Item	Status	Notes
Public documentation / tutorials	Available	Wallet, node, mining, contracts, and tutorials present
Working blockchain / explorer	Available	Live mainnet with public explorer
Wallet & developer tooling	Available	CLI, wallet support, node software
Audit reports	Not evident	Independent public audits not prominently found
Legal opinion / token classification	Unknown	Not clearly demonstrated in reviewed sources
Corporate structure & KYC/KYB	Pending	To be submitted under NDA for listing processing
Tokenomics & vesting schedule	Partial / Incomplete	Required for conditional approval
Exchange API / uptime metrics	Unknown	Transparent API docs and uptime metrics needed
Organic trading volume / liquidity	Not evident	Placeholder metrics ("N/A") observed publicly

Regulatory Considerations

Major exchanges increasingly require a legal opinion on token classification, sanctions screening, AML/KYC considerations, jurisdictional compliance, and a clear corporate structure. Public information reviewed does not clearly demonstrate these elements. With MiCA and similar frameworks becoming increasingly important, regulatory preparedness is a significant evaluation factor for any path to conditional listing approval.

5. TEAM & GOVERNANCE

Public materials reviewed emphasize product and infrastructure more than a fully disclosed corporate and governance package. A Tier-1 exchange will typically require formal identity, entity, and governance materials before conditional approval can proceed.

Required Information for Listing Eligibility

The full team structure, core contributors, and legal entity details **must be provided under NDA (KYC/KYB)** for official listing processing:

- **Founders / executives:** Legal names, roles, bios, and background verification
- **Key technical owners:** Protocol lead, security owner, infrastructure specialists
- **Entity structure:** Operating company or foundation, jurisdiction, and legal signatories
- **Governance roadmap:** How protocol parameters are controlled and what role ANM holders play
- **Community metrics package:** Social engagement, GitHub activity, developer adoption, wallets, active addresses, and transaction growth

6. MARKET POSITION & COMPETITIVE LANDSCAPE

6.1 Sector: Post-Quantum L1 / Verifiable Compute

Animica is positioned as a live Layer-1 with post-quantum cryptography and useful-work / verifiable compute ambitions, supported by a public product stack including wallet, explorer, mining, tutorials, and a trading interface. This combination places the project in an emerging category that blends infrastructure utility with developer-facing tooling.

✓ Competitive Advantages

- **Functional ecosystem:** Native chain, wallet, explorer, contracts, mining, and docs
- **Developer tooling:** CLI, node deployment, contract deployment, and mining commands
- **Infrastructure readiness:** Trading portal, academy/tutorials, and node software reduce integration risk
- **Live mainnet:** Moves beyond whitepaper-only status into an operating public network

6.2 Market Evidence Gaps

The exchange interface currently displays placeholder metrics ("N/A") for trading volume, active traders, and uptime rather than established market activity. Top exchanges evaluate daily volume, organic liquidity, spread quality, order book depth, and wash trading indicators. Current public evidence is insufficient to support a strong liquidity diligence conclusion.

Separately, community and adoption metrics — including real social engagement, GitHub activity, developer adoption, ecosystem partners, wallets, active addresses, and transaction growth — should be compiled into a formal listing package for committee review.

7. RISK ANALYSIS

Risk Category	Assessment	Notes
Market liquidity	High	Placeholder volume / trader / uptime metrics; insufficient organic market evidence
Security transparency	Medium-High	No prominent public audits, bug bounty, penetration testing, or incident-response materials found
Regulatory readiness	High	Legal opinion, AML/KYC, and corporate structure not clearly evidenced
Token metrics disclosure	Medium	Supply, vesting, treasury, emissions, and concentration data not readily available
Community / adoption proof	Medium	Metrics should be compiled into a formal listing package
Technology / product	Low	Working chain, tooling, explorer, and documentation are comparatively strong

Overall Risk Assessment: While Animica demonstrates stronger technical foundations than many early-stage projects, the risk profile for Tier-1 listing remains elevated due to liquidity, regulatory documentation, security transparency, and tokenomics disclosure gaps. These are the primary dependencies for moving from preliminary review to conditional approval.

8. CONDITIONS FOR MOVING TO CONDITIONAL APPROVAL

Before Upbit can consider a **conditional listing approval** for ANM, the following minimum conditions should be met. These conditions align with standard Tier-1 diligence expectations covering token design, security, legal readiness, market integrity, and operational integration.

1. Tokenomics & Market Data

- Canonical tokenomics document covering supply, vesting, treasury, and emissions
- Circulating supply and unlock schedule disclosure suitable for exchange diligence
- Verifiable trading volume, liquidity, and uptime metrics replacing placeholder statistics

2. Security Transparency

- Independent smart contract / protocol audit reports from reputable third parties
- Published security policies and incident response procedures
- Evidence of penetration testing and/or a bug bounty program where applicable

3. Legal Opinion

- External counsel memo addressing token classification in key jurisdictions, including Korea
- Compliance considerations for distribution, promotion, consumer, and securities laws
- Sanctions screening and AML/KYC framework documentation

4. Team & Entity KYC/KYB

- Verified identities of founders / key signatories
- Incorporation docs for the operating company / foundation and authorized signatories
- Full team disclosure under NDA for listing processing

5. Liquidity & Market-Making Plan

- Proposed liquidity budget and counterparties for an Upbit listing window
- Expected daily volume, order-book depth, and slippage targets
- Engagement of professional market makers where appropriate

6. Operational Readiness

- Transparent API documentation and operational uptime metrics
- Final technical integration details (custody support, deposit/withdraw routes)
- Commitment to standard incident-response and communication procedures
- Measurable ecosystem metrics package (users, developers, transactions, partners)

9. PRELIMINARY RECOMMENDATION

Based on publicly available information, Animica appears to have stronger technical foundations than many early-stage crypto projects, with a functioning blockchain ecosystem, developer tooling, educational resources, and a trading interface. However, it lacks several of the governance, regulatory, liquidity, and transparency signals that top-tier centralized exchanges typically evaluate. Public listing criteria emphasize functional infrastructure alongside verifiable trading activity, security, legal readiness, and transparent market data.

✓ Recommendation: Eligible for Preliminary Listing Review

Rationale:

- Project has a **working product stack** — chain, wallet, explorer, mining, contracts, and docs are live
- **Developer experience and infrastructure** reduce operational integration risk relative to early-stage peers
- Public documentation indicates more than a simple token launch and supports preliminary technical diligence
- Primary gaps remain in **liquidity evidence, security transparency, legal/compliance materials, and tokenomics disclosure**

📋 Next Steps for Conditional Listing

1. Submit finalized **tokenomics & vesting schedule**
2. Provide **independent security audit reports** and a published security policy
3. Provide **legal opinion(s)** covering token classification in target jurisdictions (including Korea)
4. Provide **team KYB/KYC** documents under NDA
5. Propose a **liquidity provisioning plan** with expected daily volume and order-book depth
6. Replace placeholder market metrics with **verifiable trading and uptime data**
7. Prepare a professional exchange due-diligence package covering technology, governance, legal, security, and market data

✓ Status: ELIGIBLE FOR PRELIMINARY LISTING REVIEW

Upbit can continue dialogue with the Animica team and request the materials above. With stronger liquidity, independent security validation, comprehensive token disclosures, and regulatory documentation, Animica's prospects for listing on leading exchanges would likely improve substantially. A more formal **Conditional Listing Report** should be drafted once tokenomics, audits, legal memos, and verifiable market data are available and verifiable.
