

PRELIMINARY LISTING REPORT

Project Information

Reference ID: **6366A1C3**

Project Name: Perceptron Network

Token Symbol: PERC

Classification: AI / DePIN / Decentralized
Data Infrastructure

Blockchain: Unconfirmed (Solana / Base)

Website: perceptrons.xyz

Network Status: Public product live

Listing Classification

Token Type: Fungible utility + micro-NFTs

Listing Type:

HOLD / ENHANCED DD REQUIRED

Report Date: August 22, 2026

Assessment Status: **Watchlist / Enhanced DD**

Prepared for: Upbit Listings Committee

1. EXECUTIVE SUMMARY

Perceptron Network presents itself as an AI/Web3 infrastructure project combining decentralized bandwidth and data collection with an incentive and reputation layer for AI agents. Public materials claim 700,000+ nodes globally and describe PERCs as tiered micro-NFTs that reward contributions and establish trust signals, alongside a separate **\$PERC** fungible token used for community rewards and agent staking.

There is evidence of a real project and ecosystem activity: public documentation, a Chrome extension with hundreds of reviews, a reported strategic financing round, and a 2025 merger involving BlockMesh. However, the token currently presents material exchange-listing risks. Public market data is fragmented across multiple tokens using the PERC name/symbol, identifiable Solana liquidity is extremely thin, Phantom labels the Solana PERC token unverified, and the top 10 holders reportedly control 98.28% of that token's supply.

✓ Positive Finding: Credible Product Surface

Public documentation, an active website, a Chrome Web Store listing, a reported BlockMesh merger, and claimed node/user activity indicate more than a ticker-only launch and support continued product diligence.

✗ Critical Finding: Canonical Token Not Established

Project documentation and currently discoverable market contracts do not provide enough clarity to establish a single, authoritative, exchange-ready PERC contract and token distribution model. An exchange should not rely on ticker or name matching alone.

⚠ Overall Risk Rating: HIGH / RED

Listing recommendation at this stage is **do not list**. Place PERC on enhanced due-diligence / watchlist status until contract identity, liquidity, holder distribution, and quantitative tokenomics can be independently verified. Principal blockers are an unconfirmed canonical contract, multiple public PERC tokens, ~\$2.5K–\$2.8K observable liquidity, 98.28% top-10 concentration, and insufficient exchange-grade tokenomics disclosure.

2. PROJECT & PRODUCT OVERVIEW

Perceptron Network describes itself as an AI-agent infrastructure and decentralized data network. Its stated model involves users sharing unused bandwidth, collecting and providing data for AI applications, rewarding participants, and allowing AI agents to use PERCs as trust and engagement signals. Agents are described as generating revenue through PERC sales or auctions, while \$PERC is distributed to qualifying community members and used for agent staking.

2.1 Protocol Functions

- **Decentralized bandwidth sharing:** Users contribute unused bandwidth to the data network
- **AI data collection:** Nodes gather or provide data used by AI applications
- **PERC micro-NFTs:** Tiered on-chain trust metrics rewarding contribution and engagement
- **Agent incentive layer:** AI agents use PERCs as trust, reputation, and engagement signals
- **\$PERC utility token:** Community rewards, ecosystem access, and agent staking

2.2 Vision & Impact

A 2025 announcement following the Perceptron / BlockMesh merger reported 700,000+ active nodes and 200,000+ users engaged through Perceptron Agents. These figures are project-reported and should be independently verified before use in a listing profile. A third-party database records a July 2026 strategic round and approximately \$6.5M in funding; aggregator figures are inconsistent and should not be treated as verified without primary-source confirmation.

✓ Assessment: Coherent AI / DePIN Thesis

The combination of a live public product, documentation, Chrome extension, and announced partnership/merger activity supports a more credible product review than a whitepaper-only token. This does not, by itself, establish listing readiness for the \$PERC market asset.

3. TOKEN DESIGN & UTILITY

Token Specifications

- **Token Name:** PERC (fungible utility token; distinct from PERC micro-NFTs)
- **Blockchain:** Not canonically confirmed — Solana and Base candidates observed
- **Network Status:** Public markets exist; official contract unverified
- **Total / Circulating Supply:** ~994.07M on the Phantom-indexed Solana token (unverified)

3.1 Use Cases

- **Community rewards:** Distribution to high-trust members based on PERC NFT holdings and tiers
- **Agent staking:** AI agents stake \$PERC for premium functionality
- **Ecosystem access:** IP partnerships, games, and agent interoperability
- **Trading:** Fragmented public markets; no demonstrated mature spot price-discovery venue

⊖ Contract Ambiguity — Major Listing Blocker

Public sources identify several PERC tokens using the Perceptron name across Solana and Base, including a Phantom-unverified Solana token with 189 holders, 98.28% top-10 concentration, and ~\$2.5K liquidity. Documentation does not provide exchange-grade supply, allocation, vesting, or unlock data. **Which exact contract is the official listing asset?**

4. DOCUMENTATION & COMPLIANCE STATUS

The matrix below summarizes publicly reviewed documentation and compliance posture relevant to preliminary listing diligence. Current status for tokenomics and smart-contract assurance is **RED / insufficient disclosure**.

Document / Item	Status	Notes
Public documentation / product materials	Available	Website and docs describe product and token mechanics
Public product / Chrome extension	Available	Chrome Web Store listing: 4.6/5 from 817 ratings
Canonical contract / explorer verification	Not established	Multiple PERC contracts; Phantom labels Solana token unverified
Audit reports	Not evident	Independent public audits not obtained; smart-contract DD incomplete
Legal opinion / token classification	Unknown	Jurisdiction-specific legal analysis required before listing
Corporate structure & KYC/KYB	Pending	Privacy policy names Perceptron Network Inc. and Ohad Dahan; unverified
Tokenomics & vesting schedule	Insufficient	Role of \$PERC / NFTs described; quantitative allocations not disclosed
Organic trading volume / liquidity	Extremely weak	Identifiable Solana market ~\$2.5K–\$2.8K liquidity

Regulatory Considerations

Stated functions include rewards, staking, ecosystem access, and potentially economic participation in an AI-agent ecosystem. Upbit should obtain a formal legal opinion addressing the token's regulatory characterization in each jurisdiction where it would be made available, including Korea. With MiCA and similar frameworks becoming increasingly important, regulatory preparedness is a significant evaluation factor. Public information reviewed does not clearly demonstrate legal-entity documentation, beneficial-owner information, sanctions screening, AML/KYC policies, or a history of regulatory inquiries.

5. TEAM & GOVERNANCE

Public materials reviewed emphasize product narrative and network traction more than a fully disclosed corporate and governance package. The project's privacy policy identifies **Perceptron Network Inc.** and a third-party developer, **Ohad Dahan**, but this should be independently verified against corporate records and legal documents supplied to the exchange. Domain WHOIS ownership is privacy-protected.

Required Information for Listing Eligibility

The full team structure, core contributors, and legal entity details **must be provided under NDA (KYC/KYB)** for official listing processing:

- **Founders / executives:** Legal names, roles, bios, background verification, and beneficial-owner disclosure
- **Legal entity:** Incorporation documents, jurisdiction, directors/officers, and authorized signatories
- **Key technical owners:** Protocol lead, token-contract owner, security owner, and admin-key custodians
- **Governance / authorities:** Mint, freeze, upgrade, pause, blacklist/whitelist, and transfer-tax controls
- **Community metrics package:** Independently verified nodes, users, extension installs, GitHub activity, and partner confirmations

6. MARKET POSITION & COMPETITIVE LANDSCAPE

6.1 Sector: AI / DePIN / Decentralized Data Infrastructure

Perceptron Network is positioned as an AI-agent infrastructure and decentralized data network, combining unused-bandwidth contribution with incentive and reputation mechanics. Public presence includes an established website (domain since January 2025, active TLS), documentation, a Chrome extension, a publicly announced partnership with Xenea, and a reported merger with BlockMesh.

✓ Competitive Advantages

- **Product thesis:** Coherent AI / DePIN narrative with documented incentive mechanics
- **Public presence:** Website, documentation, and Chrome extension (4.6/5 from 817 ratings)
- **Claimed network activity:** Project-reported 700,000+ nodes and 200,000+ users post-merger
- **External signals:** Reported financing and announced Xenea / BlockMesh relationships

6.2 Market Evidence Gaps

The identifiable Solana PERC market has only around \$2.5K–\$2.8K liquidity, ~\$1.3K–\$1.4K reported market capitalization, 189 holders, and 98.28% top-10 concentration, and is unlabeled/unverified on Phantom. Multiple PERC contracts exist on Solana and Base. At this depth, even modest exchange-generated trading could distort price. Independent reputation services conflict (Scam Detector 49.1/100; Gridinsoft 16/100); these scores are not proof of fraud but justify additional security review. Figures are third-party snapshots and should be rechecked on-chain.

7. RISK ANALYSIS

Risk Category	Assessment	Notes
Contract identification	Critical	Multiple PERC tokens/contracts; no sufficiently established canonical listing asset
Market liquidity	Critical	~\$2.5K–\$2.8K observable Solana liquidity; no mature price-discovery market
Holder concentration	Critical	Top 10 holders reportedly control 98.28% of the Phantom-indexed Solana token
Token metrics disclosure	High	Supply, allocation, vesting, treasury, MM, and insider unlocks not exchange-grade
Smart-contract assurance	High	Mint/freeze/upgrade/admin, fees, pause, and LP-lock status not verified
Regulatory readiness	Medium–High	Legal opinion, AML/KYC, entity, and beneficial-owner materials not clearly evidenced
Security / reputation signals	Mixed	WHOIS privacy; conflicting automated domain scores; no proof of fraud by itself
Technology / product	Low–Medium	Public product, docs, extension, and claimed network activity are comparatively stronger

Overall Risk Assessment: HIGH / RED. This is not a conclusion that Perceptron Network is fraudulent. The project appears to have a genuine AI/DePIN thesis and meaningful claimed user/network activity. The currently observable PERC market is, however, nowhere near the liquidity, distribution, token-identification, and disclosure standard expected for a centralized-exchange listing.

8. CONDITIONS FOR MOVING TO CONDITIONAL APPROVAL

Before Upbit can consider a **conditional listing approval** for PERC, the following minimum conditions should be met. These conditions align with standard Tier-1 diligence expectations covering token identity, security, legal readiness, market integrity, and operational integration.

1. Canonical Token & Tokenomics

- Official chain(s), canonical contract address(es), deployment transaction, and explorer verification
- Complete schedule: max/initial/circulating supply; team/investor/ecosystem/airdrop/treasury/MM/LP allocations; vesting, cliffs, and unlock dates
- Wallet addresses for major allocations and top-holder disclosure

2. Security Transparency

- Independent smart-contract audit; mint/freeze/upgrade authority and admin-privilege analysis
- Transfer-tax, blacklist/whitelist, pause, max-wallet/tx, proxy, bridge, and wrapped-token review
- Multisig configuration, LP lock/burn evidence, incident history, and published incident-response procedures

3. Legal Opinion

- External counsel memo addressing token classification in key jurisdictions, including Korea
- Sanctions screening, AML/KYC framework, jurisdictional restrictions, and regulatory-history disclosure
- Privacy / data-processing documentation consistent with the node and bandwidth-sharing model

4. Team & Entity KYC/KYB

- Verified corporate documents for Perceptron Network Inc. (or successor entity) and authorized signatories
- Founders / team KYC, beneficial-owner disclosure, and independent confirmation of named parties (including Ohad Dahan)
- Full team disclosure under NDA for listing processing

5. Liquidity & Market-Making Plan

- Verified liquidity pools, LP ownership/lock evidence, historical volume, and organic-activity attestation
- Proposed liquidity budget, market-maker agreement, expected daily volume, depth, and slippage targets
- Evidence that reported trading activity is organic and not distorted by thin books or concentrated holders

6. Operational Readiness

- Official exchange integration contact; deposit/withdrawal testing; chain reorg/finality assessment
- Incident-response contact, token migration plan, and custody support for the designated chain(s)
- Independently verified ecosystem metrics (nodes, users, extension, partners) replacing project-reported figures

Smart-Contract Diligence Status: INCOMPLETE

The Base PERC contract indexed by Clanker, for example, shows a 1% buy fee and 1% sell fee, but that is not sufficient evidence that it is the official Perceptron token. Until the project designates a canonical contract and provides the authority, audit, LP-lock, and treasury items above, smart-contract assurance remains insufficient for listing.

9. PRELIMINARY RECOMMENDATION

Based on publicly available information, Perceptron Network appears to be a genuine AI/DePIN project with a coherent product thesis, public documentation, and claimed network activity. It lacks several of the token-identity, liquidity, distribution, tokenomics, and security signals that top-tier centralized exchanges typically require. Public listing criteria emphasize a single canonical asset alongside verifiable trading activity, holder distribution, security, legal readiness, and transparent market data.

— Recommendation: Conditional Rejection / Hold — Enhanced Due Diligence Required

Rationale:

- Canonical token contract is **not sufficiently established**; multiple PERC tokens/contracts exist publicly
- **Extremely low observable liquidity** (~\$2.5K–\$2.8K) and **severe holder concentration** (98.28% top 10)
- Insufficient public quantitative tokenomics and no demonstrated mature price-discovery market
- Smart-contract permissions, LP locks, and security posture require direct project verification
- This is **not** a finding of fraud; it is a finding that current evidence is inadequate for a responsible CEX listing

📋 Next Steps Before Any Reconsideration

1. Designate and prove the **official PERC contract** (chain, address, deployment, explorer verification)
2. Submit finalized **tokenomics, allocation, and vesting** with wallet addresses
3. Provide **independent security audit** and admin-key / mint / freeze analysis
4. Provide **legal opinion(s)** covering token classification in target jurisdictions (including Korea)
5. Provide **team KYB/KYC** and beneficial-owner documents under NDA
6. Propose a **liquidity provisioning plan** with MM terms, depth targets, and LP-lock evidence
7. Reconcile supply, holders, authorities, and liquidity independently on-chain

⚠️ Status: HOLD / ENHANCED DUE DILIGENCE — DO NOT LIST AT THIS STAGE

Upbit should not approve spot listing of PERC based on currently verifiable public information. Dialogue may continue on a watchlist basis while the project submits an exchange due-diligence package covering identity, token, security, market, legal, and operational items above. The first priority is to establish the canonical PERC contract and independently reconcile its supply, holders, tokenomics, authorities, and liquidity. A more formal **Conditional Listing Report** should be drafted only after those materials are available and verifiable.
